Claim New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

20; SEQ ID NO 30992; 103pp; English.

The invention relates to isolated polymucleotide (I) and polypeptide (II) consequences, (I) is useful as hybridisation probes, polymerase chain creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes, (I) is useful in gene therapy techniques to restore normal cartivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a CC useful for generating antibodies against it, detecting or quantitating a CC useful for generating antibodies against it, detecting or quantitating a CC of sites expressing (II). (I) and (II) are useful for treating disorders involving abarrant protein expression or biological activity. The CC polypeptide and polymucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in CC electronic format directly from WIPO at CC patentic format format format for this contents format format ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2003-569235/53.

The colon cancer antigens have cytostatic activity and can be used in gene therapy cand vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For cexample, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome contact affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent carcinomas sued in the prevention, diagnosis and treatment of colorectal carcinomas sued in the exemplification of the present invention. N.B. C pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922
                                                                                                                                                                                                                                                        Query Match

```

Human ORFX ORF2168 polypeptide sequence SEQ ID NO:4336.

08-FEB-2001

(first entry)

AAB42404;

```
CC which represent the human ORFX open reading frames 1 to 3161. The ORFX CC sequences have activitles such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; ostepathic; CC cardiant; thrombolytic; coagulant; vasctropic; antidiabetic; hypotensive; CC dermatological; immunosuppressive; antiinflammatory; antibacterial; CC antiviral; antifungal; antirheumatic; antiinflammatory; and antianaemic. The csquences can be used for determining the presence of or predisposition conditions associated with an CC ORFX-associated disorder. The nucleic acids can be used to express ORFX CC proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative cdisorders, osteoarthritis, graft vs host disease, cardiovasqular disease, storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune contained damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive

delta large antigen - hepatitis delta virus (strain CAR)
N;Alternate names: HDAg
C;Species: hepatitis delta virus
C;Species: hepatitis delta virus
C;Apecies: nepatitis delta virus
C;Accession: JQ2167
R;Tang, J.R.; Hantz, O.; Vitvitski, L.; Lamelin, J.P.; Parana, R.; Cova, L.;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Experimental source: isolate CAR, inche: the authors translated the codon CGA for residue 85 as nothing and AGA for residuent: This protein is one of hepatitis delta virus specific-proteins.

Superfamily: hepatitis delta virus large antigen

Superfamily: hepatitis delta virus large antigen

Keywords: core protein; lipoprotein; methylated carboxyl end; prenylated cysteine

204/Binding site: farmesyl (Cys) (covalent) #status predicted

204/Modified site: methyl ester carboxyl end (Cys) (in mature form) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

SwissProt_42:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RNA-BINDING SPECIFICITY.

Lin J.-H., Chang M.F., Baker S.C., Govindarajan S., Lai M.M.C.,

"Characterization of hepatitis delta antigen: specific binding the hepatitis delta virus RNA.",

J. Virol. 64.4051-4058(1990).

-i- SUBCELLULAR LOCATION: Nuclear.

-i- PTM: Phosphorylated.

-i- DISEASE: BINDS SPECIFICALLY TO ANTISERA FROM PATIENTS WITH (

HEPATITIS DELTA VIRAL INFECTIONS.

-i- MISCELLANEOUS: Delta antigen binds specifically to HDV RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PIR; A40247; SAVLLL.

-!- SIMILARITY: Belongs to peptidase family M12B.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 disintegrin domain.

TISSUE SPECIFICITY: Expressed predominantly in brain. Slighly detected or not at all in other tissues.

DOMAIN: A conserved motif [AVN(B/D)CD] within the disintegrin-like domain could be involved in the binding to the integrin receptor.

PTM: The precursor is cleaved by a furin endopeptidase (By eighteen)

C -!- FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, C calcium and phospholipid during blood clotting.

C -!- CATALYTIC ACTIVITY: Preferential cleavage: Arg--Thr and then Arg-|-IIE bonds in prothrombin to form thrombin.

C -!- SUBUNIT: The two chains are formed from a single-chain precursor by the excision of two Arg residues and are held together by 1 or more disulfide bonds.

C -!- FIM: The vitamin K-dependent, enzymatic carboxylation of some glutamate residues allows the modified protein to bind calcium (By control of the control of the calcium of some glutamate residues allows the modified protein to bind calcium (By control of the calcium of the calcium of some calcium of the calcium of some calcium of the calcium of some c

(BY SIMILARITY).

(BY SIMILARITY).

(BY SIMILARITY).

Calcium also binds, with stronger affinity to another site, beyond the GLA domain.

SIMILARITY: Belongs to peptidase family \$1.

SIMILARITY: Contains 2 EGF-like domains.

similarity).

PTM: N- and O-glycosylated (By similarity).

PTM: THE ACTIVATION PEPTIDE IS CLEAVED BY FACTOR IXA (IN THE PTM: THE ACTIVATION PEPTIDE IS CLEAVED BY FACTOR IXA (IN THE EXTRINSIC PATHWAY).

INTRINSIC PATHWAY), OR BY FACTOR VIIA (IN THE EXTRINSIC PATHWAY)

-- FUNCTION: Component of the COPII coat, that covers ER-derived vesicles involved in transport from the endoplasmic reticulum to the Golgi apparatus. COPII is composed of at least five proteins: the SEC33/24 complex, the SEC13/31 complex, and the protein SAR1. Acts in the cytoplasm to promote the transport of secretory, plasma membrane, and vacuolar proteins from the endoplasmic plasma membrane, and vacuolar proteins from the endoplasmic reticulum to the Golgi complex (By similarity).

CONCENTRATION.

-!- DISEASE; Defects in IPF1 are a cause of pancreatic agenesis (MIM:260370). This autosomal recessive disorder is characterized by absence or hypoplasia of pancreas, leading to early-onset insulin-dependent diabetes mellitus. This was found in a frameshift mutation that produces a truncated protein and results in a second initiation that produces a second protein that act as a dominant negative mutant.

-!- DISEASE: Defects in IPF1 are a cause of susceptibility to noninsulin-dependent diabetes mellitus (NIDDM) (MIM:12883); also known as diabetes mellitus type II.

-!- DISEASE: Defects in IPF1 are the cause of maturity onset diabetes of the young type IV (MODY4) (MIM:60392); also symbolized MODY-IV. MODY4 is a form of non-insulin-dependent diabetes mellitus (NIDDM) characterized by an autosomal dominant mode of inheritance, age of onset of 25 years or younger and a primary defect in insulin secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to type 2 diabetes.";

Submitted (CCT-1995) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Activates insulin and somatostatin gene transcription.
Key regulator of islet peptide hormone expression but also responsible for the development of the pancreas, most probably by determining maturation and differentiation of common pancreatic precursor cells in the developing gut. Binds the DNA sequence 5'-CC[CT]TAATGGG-3' (By similarity).
-!- SUBCCLLULAR LOCATION: Nuclear (By similarity).
-!- TISSUE SPECIFICITY: Pancreas; islet beta-cells (By similarity).
-!- DOMAIN: The Autp-type hexapeptide mediates heterodimerization of IPF1 with PBX on a regulatory element of the somatostatin promoter
